TITLE OF THE INVENTIONBIOLOGICALLY ACTIVE COMPOUNDS AND PROCESS
THEREFORBACKGROUND OF THE INVENTION

5

Hypercholesterolemia is known to be one of the prime risk factors for ischemic cardiovascular disease, such as arteriosclerosis. Bile acid sequestrants have been used to treat this condition; they seem to be moderately effective but they must be consumed in large quantities, i.e. several grams at a time, and they are not very palatable.

10

MEVACOR® (lovastatin) and ZOCOR® (simvastatin), now commercially available, are members of a group of very active antihypercholesterolemic agents that function by limiting cholesterol biosynthesis by inhibiting the enzyme, HMG-CoA reductase.

15

Squalene synthase is the enzyme involved in the first committed step of the de novo cholesterol biosynthetic pathway. This enzyme catalyzes the reductive dimerization of two molecules of farnesyl pyrophosphate to form squalene. The inhibition of this committed step to cholesterol should leave unhindered biosynthetic pathways to ubiquinone, dolichol and isopentenyl t-RNA.

20

Previous efforts at inhibiting squalene synthase have employed pyrophosphate or pyrophosphate analogs containing compounds such as those described in P. Ortiz de Montellano, et al., J. Med Chem., 20, 243 (1977) and E.J. Corey and R. Volante, J. Am. Chem. Soc., 98, 1291 (1976). S. Biller (U.S. Patent 4,871,721) describes isoprenoid (phosphinylmethyl)phosphonates as inhibitors of squalene synthase.

25

Recently certain nonphosphorous containing inhibitors of squalene synthase have been isolated as natural products. These natural product inhibitors are described in US Patents 5,102,907; 5,132,320; 5,096,923; 5,026,554; 5,055,487; and 5,053,425. A need still remains for a more effective squalene synthase inhibitor, i.e. one that provides a greater antihypercholesterolemic effect and exhibits a good safety profile.

30

The present invention is directed to semi-synthetic analogs of the above-noted natural products, and a novel process for making them.

Except where specifically defined to the contrary, the word "alkyl" includes both branched and straight chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms, such as, e.g., methyl (Me), ethyl (Et), iso-propyl (i-Pr), and tert-butyl (t-Bu). Acyl, i.e. -COCH₃, is abbreviated herein as "Ac", phenyl is "Ph", and ethyl acetate is "EtOAc."

The compounds of formula I can be prepared from (1S, 3S, 4S, 5R, 6R, 7R)-1-[(4S)-acetoxy-3-methyl-ene-5-methyl-6-phenyl]-hexyl-4,6,7-trihydroxy-6-O-(4,6-dimethyl-2-octenoyl)-2,8-dioxabicyclo[3.2.1]octane-3,4,5-tricarboxylic acid (referred to herein as Compound IA), or (1S, 3S, 4S, 5R, 6R, 7R)-1-[(4)-acetoxy-5-methyl-6-phenyl]hexyl-4,6,7-tri-hydroxy-6-O-(6-methyl-9-phenyl-4-nonenoyl)-

- 7 -

2,8-dioxabicyclo[3.2.1]-octane-3,4,5-tricarboxylic acid (referred to herein as Compound IC) according to the sequences described in Schemes A, B and C. The preparation of the starting materials, IA and IC, are described in U.S. Patents 5,096,923 and 5,102,907, respectively. Although Schemes A-C depict the use of Compound IA and derivatives thereof, the same methods can be used employing Compound IC and its derivatives. Furthermore, Scheme C, as well as Schemes A and B, can be used to make the compounds of the invention, but can also be used by one skilled in the art to synthesize a broader range of C-3, C-4 diester products. For example, one could use starting materials with a broader range of R¹ and R² groups and/or having an ether at the 7-position, or one could use other appropriate alcohols, alkyl halides, etc., to form a variety of esters at the C-3, C-4 and C-5 positions using the described methods.

Compounds are named in the examples and in some places throughout the description as ester derivatives at the C3, C4 and/or C5 carboxylic acid positions of compounds IA and IC as, e.g., IA-3-ethyl-4-pivaloyloxymethyl diester (Compound II in Table 1 wherein Z¹ is ethyl and Z² is pivaloyloxymethyl), and IC-3-n-propyl ester (Compound III in Table 2 wherein Z¹ is n-propyl and Z² is -H).

SCHEME A:

C-3 monoesters (1) may be prepared by several procedures. Stirring IA in an alcohol of formula Z¹-OH, wherein Z¹ is defined above, in the presence of an acid such as sulfuric acid or hydrochloric acid that can be added or generated *in situ* by the addition of acetylchloride to the alcohol solvent used gives selective esterification at C-3 to produce (1). IA-3,4-diester (IIA) can be prepared from C-3 monoesters (1) by stirring a C-3 monoester (1) with a base such as 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) and an appropriate alkyl halide of formula Z²-X, wherein X is a halide such as -Cl, -Br, or -I and Z² is defined above, in a solvent such as benzene, tetrahydrofuran (THF) or acetonitrile. This reaction condition also produces the C-3,C-5-diester and the C-3,C-4,C-5-triesters of IA which can be separated by

- 8 -

chromatographic methods such as preparative thin layer chromatography on silica gel using solvents such as methylene chloride and acetone with small amounts of acetic acid added (a typical ratio would be 88/8/4 CH₂Cl₂/acetone/acetic acid by volume) or by
5 preparative high pressure liquid chromatography on reverse-phase packing such as ZORBAX RX C8 eluting with a gradient solvent system beginning with acetonitrile/water (1:1 with 0.005% trifluoroacetic acid) and increasing eluting power to 100% acetonitrile (with 0.005% trifluoroacetic acid). In this reaction, using one equivalent of base to
10 substrate ratio mainly gives the C-3,C-4-diesters, while a base to substrate ratio of two or more gives mainly the C-3,C-5-diesters or C-3,C-4,C-5-triesters as the major product.

SCHEME B:

15 When the C-3 monoesterification in Scheme A is carried out in benzyl alcohol, the C-3 benzyl ester (2) formed can be used as a C-3 protecting group. This allows modification of the C-4 and C-5 carboxyl groups to produce (3) by forming esters in these positions with an isourea reagent such as O-t-butyl-N,N'-diisopropyl-isourea.
20 [Mathias, L. J., Synthesis, 561-576 (1979)]. IA-4,5-di-t-butyl diester (4) can be prepared from IA-3-benzyl-4,5-di-t-butyl ester (3) by removing the benzyl group by hydrogenolysis with Pd/C and hydrogen gas or transfer hydrogenolysis with Pd/C and methyl cyclohexadiene. IA-4,5-di-t-butyl diester (4) can be modified at the C-3 position by
25 several procedures. For example, IA-4,5-di-t-butyl diester (4) may be treated with N-methyl morpholine followed by isobutylchloroformate to form a mixed anhydride which reacts well with various alcohols to form the corresponding IA-3-Z1-4,5-di-t-butyl triesters (5). IA-4,5-di-t-butyl diester (4) may also be treated with coupling reagents such as
30 carbonyl diimidazole, thionyl chloride, benzotriazol-1-yloxytris-(dimethylamino)phosphonium hexafluorophosphate (BOP reagent) or any of the other standard coupling reagents known to those skilled in the art, such as dicyclohexylcarbodiimide (DCC) or 2-ethoxy-1-ethoxycarbonyl-1,2-dihydroquinolone (EEDQ), followed by an alcohol

- 9 -

to form esters (5). Also IA-4,5-di-t-butyl diester (4) can be converted to the triester (5) by stirring with an Z¹O-N,N'-dialkyl-isourea in a solution such as toluene, benzene, acetonitrile, tetrahydrofuran (THF) and/or dimethoxyethane (DME). [Mathias, L. J., Synthesis, 561-576 (1979)]. The C-4,C-5-di-t-butyl ester groups may be removed later by stirring the triester (5) formed with trifluoroacetic acid (TFA) in methylene chloride to form (1). The C-3 monoesters (1) thus produced may be transformed into the C-3,C-4-diester (IIA) as described in Scheme A.

SCHEME C:

As an alternative to the method of Scheme B, the triester (5) can be selectively saponified at the C-4 position by action of certain Lewis acids such as thionyl chloride, tin(IV) chloride or hydrogen fluoride. A catalytic amount of tin(IV) chloride is used for the saponification, e.g. between 0.05 to 0.5 equivalents per one equivalent of triester (5), with stirring at room temperature for about one to twenty hours; 0.05 equivalents of tin(IV) chloride with stirring for 18 to 20 hours is preferred. An excess of thionyl chloride is used to saponify the triester (5), e.g., from about 40 to 60 equivalents of thionyl chloride per one equivalent of (5), and the reaction is stirred for about 3 to 4 days at room temperature. When hydrogen fluoride is used in this step, a large excess of hydrogen fluoride, e.g. about 350 to 400 equivalents, is used per one equivalent of (5), and the reaction is stirred for about 8 hours to obtain the diester (6). This provides a C-3,C-5 diester (6) that can be esterified at the 4-carboxylic acid to form the IA-3-Z¹-4-Z²-5-t-butyl triester (7) by treatment with one equivalent each of DBU and an alkyl halide per equivalent of diester (6), as described in Scheme A. The C-3,C-5 diester (6) may also be esterified at the 4-carboxylic acid by using the procedures described in Scheme B for producing the triester (5) from the C-4,C-5-di-t-butyl diester (4). Such esterification procedures include treatment of (6) with one equivalent each of N-methyl morpholine and isobutylchloroformate to form a mixed anhydride followed by treatment with from one to five

- 10 -

equivalents of an alcohol of formula Z²-OH per equivalent of (6); treatment of (6) with one equivalent of a coupling reagent and one equivalent of the alcohol Z²-OH per equivalent of (6); or treatment of (6) with one to three equivalents of a Z²O-N,N'-dialkyl-isourea per equivalent of (6).

5 The triester (7) may be purified by flash chromatography on silica gel using solvents such as ethyl acetate and methylene chloride. The purified triester (7) may be deprotected by stirring with trifluoroacetic acid (TFA) in methylene chloride to give the compounds of this invention (IIA). The triester (5) can be made via the route
10 shown in Scheme B, or alternatively it can be prepared by reacting compound (1) with t-butyl-O-N,N'-diisopropylisourea. Compound (1) is prepared via the method shown in Scheme A.

5

Oral Mouse Assay

The compound to be tested is dissolved in 5% EMULPHOR® in 0.9% NaCl at a concentration of 24 mg/kg. The solution of the test compound is given by gavage to each mouse in a dose volume that does not exceed 0.15 ml per mouse. Six mice per group are dosed this way. After dosing of the animals, a 30 minute incubation period is allowed to elapse, and then each animal receives subcutaneously a dose of the radiolabelled tracer tritiated mevalonolactone, 0.5 microcuries, in 25 µl of saline. The tracer used is incorporated into cholesterol and the incorporation is used as a measure of *in vivo* cholesterol synthesis. After dosing with the tracer, another 30 minutes is allowed to elapse and then the animals are sacrificed. Upon sacrifice, each liver is removed and saponified in a solution of 40% KOH/ethyl alcohol overnight at 60°C. Next, the liver/40% KOH/ethyl alcohol mixture is extracted with petroleum ether (2 x 10ml) to remove the non-saponifiables, then one half of the organic layer is counted in a liquid scintillation counter. The numbers (DPMs) observed are expressed as a percentage of the control value to obtain percent inhibition of cholesterol synthesis. The control used is the vehicle (EMULPHOR® and saline).

25

Depending on the results obtained using 24 mg/kg of the compound being tested, the procedure is repeated using 12 mg/kg, 6 mg/kg, 2 mg/kg and 0.67 mg/kg, to obtain sufficient results to calculate the ED50. Representative compounds of this invention tested in this assay demonstrated ED50's of less than 8 mpk.

30

- 18 -

may be abbreviated herein as "hr(s)". The number-letter designations given in parenthesis after compound names in the Examples (e.g., 1a, 1b, 1c, 2a, etc.) correspond to the compounds depicted in Tables 1 and 2, above.

Step 3: Preparation of IA-3-n-propyl-4-pivaloyloxymethyl diester

To the product of Step 2, above, (0.5 g) in CH₃CN (10 ml) was added DBU (0.14 ml) and chloromethyl pivalate (0.14 ml). The mixture was refluxed overnight. The solution was filtered and concentrated. The residue was purified by preparative TLC (25% EtOAc in hexane) to give IA-3-propyl-4-pivaloyloxymethyl-5-t-butyl triester. The product was then dissolved in 10 ml of CH₂Cl₂ and TFA (1.6 ml) was added. The mixture was stirred overnight at room temperature. The solution was concentrated and flashed with 3 x 3ml of toluene. The residue was purified by preparative TLC (8% MeOH in CH₂Cl₂) then by preparative HPLC to yield the title compound.
